

(d) The four loss channels and why TL is separate

- **LLI** lithium-inventory loss — Li that can no longer cycle
- **LAM** loss of active material — host no longer binds Li
- **KL** kinetic loss — polarisation, not inventory
- **TL** thermodynamic/potential loss — energy only

*LLI + LAM + KL is complete for capacity; TL is required for energy.*

**SCHEMATIC — ARCHETYPAL, NOT FITTED. No panel plots measured or decomposed data; no axes carry a quantitative scale. This figure encodes the paper's method claim (onset order discriminates mechanism), not an experimental result.**
